Architects Align™ with Nature

An architecture firm with a reputation for sensitive design, cultural awareness, and award-winning environmental responsibility must reflect these traits in its own offices. That was the challenge facing these architects as they were designing their new space. With Align's superior form and flexibility, the company was able to meet these goals – and still provide a functional space for their employees.

Reason for Success It was important that their new office solution be created with an eye on the environment. By helping their space qualify for points toward a LEED® certification, Align fit the bill. Align's panel fabrics contain up to 100% recycled content and its long-lasting steel frames also contain post-consumer content for more resource efficiency.

“Sustainability is important to our firm and our designs, and is becoming more important to our clients as well. Now we can take them on tours through our office and they can see the beauty and function of environmentally conscious architecture and design,” noted the architect.

Align also helps the architect's staff by providing an efficient work area. Lower panels between workstations allow for collaboration, while matching mobile pedestals allow extra storage and seating for collaborating on team projects.

Helping the firm express its brand through texture and color was easy because Align accepts a nearly endless range of materials. Align's ability to match PANTONE® colors was used to choose the exact color of banana-green panels they wanted for the overheads.

“We were able to choose a natural palette that reflects our islands,” the architect said.

Align is the result of a simple premise: a single platform of panels, storage, and desking that provides absolute harmony between each component and endless freedom of expression for designers and facility managers.
